

Wilson Case Study

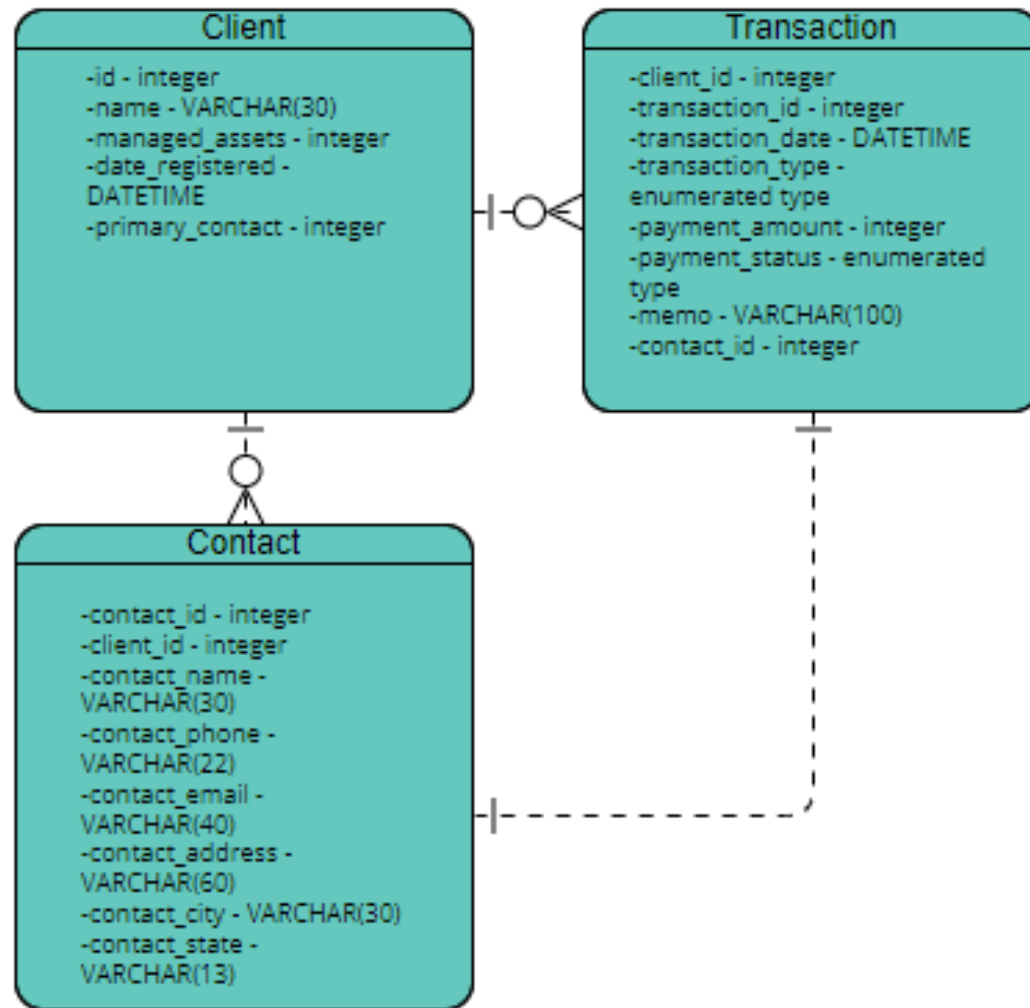

Johnathan Waugh

Kenneth Smith

For this assignment in group 6, we examined the Wilson Financial case study. In this case study, the Wilson Brothers decided to establish a financial management firm in their hometown of New Mexico. They require a database to manage their client list effectively.

ERD

We decided our case study database would hold clients & transactions to satisfy the requirements of the questions asked, as well as one or more contacts for each client.

Report 1: Average Assets

Our first script reported the average amount of assets being managed by the company for each client. This could help with creating a summary of managed assets.

```
PS C:\Program Files\MySQL> python average_assests.py
Average Assets
0      3500.0000
```

```
-----
All Client Data:
```

	Client ID	Client Name	Managed Assets
0	1	Jerry Lee	1000
1	2	Harold Johnson	2000
2	3	Candance Jones	3000
3	4	Andrew Smith	4000
4	5	Gabriel Rainey	5000
5	6	Elliott Wilson	6000

```
Minimum and Maximum Managed Assets:
```

	Minimum Assets	Maximum Assets
0	1000	6000

Report 2: Managed Assets for Each Client, Minimum & Maximum

Our second script reported the amount of assets being managed by the company for each client, as well as the minimum and maximum values.

```
.....PS C:\Python Files> python client_registrations_by_month.py
.....New client registrations by month (past 6 months):
.....-----
01/2024: 0
02/2024: 0
03/2024: 2
04/2024: 2
05/2024: 0
06/2024: 0
```

Report 3: New Registrations in Each of Past Six Months

For our final report script, we wanted to get the number of new registrations in each of the past six months. This could help with tracking the frequency of new registrations.

For a comprehensive database for this application, it would be beneficial to maintain a detailed record of the specific assets being managed. It is also crucial to manage records of client appointments to facilitate the scheduling of future appointments.

Assumptions

- During the development of Wilson Financial, several assumptions were made to ensure the system's effectiveness and security. We assumed that Wilson Financial requires a secure program to protect customer data, given the sensitivity of financial information. Thus, all data, especially financial details, is encrypted to maintain confidentiality and integrity. Additionally, we assumed that having a contact list to track clients would be useful, facilitating communication regarding their accounts or transactions. This list also serves a critical role in quickly reaching clients in the event of fraud or other urgent issues. These measures are designed to enhance client management and ensure robust security protocols.
